2026 POSYDON SCHOOL

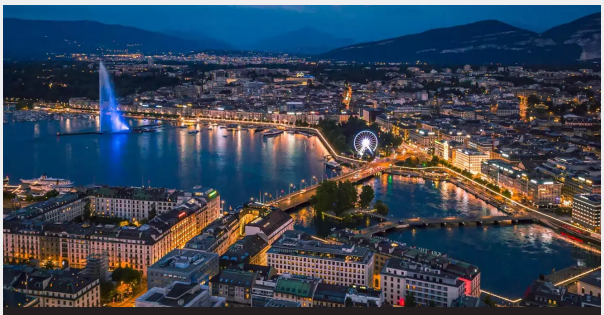
POpulation **SY**nthesis with **D**etailed binary-evolution simulati**ON**s

Join us on **August 24–27**, 2026 at the **Geneva Observatory** (Geneva, Switzerland) to learn how to use **POSYDON** (v2), a next-generation population synthesis framework that combines detailed binary-evolution simulations with machine-learning technics to model large populations of single and binary stars.

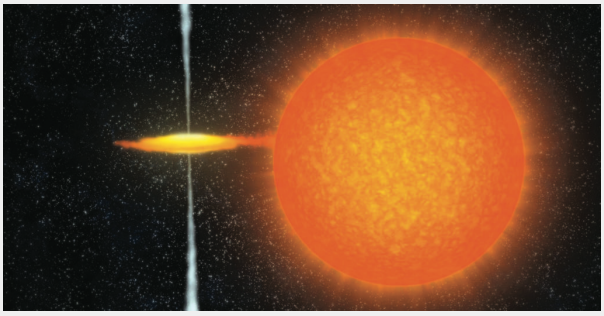
Through lectures and hands-on laboratories, participants will learn how to apply POSYDON to astrophysical problems such as mass-transfer stability, supernova progenitors, and the formation of binary black holes. The four-day school will provide practical training with the code and prepare participants to apply POSYDON in their own research.

Researchers and students at all career stages are encouraged to apply.

24-27 August 2026



Geneva, Switzerland



POSYDON School topics will include:

- Generating and analyzing binary-star populations
- Using pre-computed stellar-evolution grids
- Modeling transient populations (e.g. SNe and GW sources)
- The machine-learning framework underlying POSYDON
